

Collaboration Portal

User Stories:

TfL User

Dashboard:

- User must be able to log in.
- User will see a clear error message if the log in cannot be validated due to incorrect or incomplete input.
- User will see a clear error message if the log in fails.
- User must be able to reset password.
- User must be able to log out.
- User must land on dashboard upon log in.
- User can see a header that informs them they are on the dashboard.
- User should see local authority logo on dashboard.
- User should be able to view their user profile details.
- User can view their assigned permissions.
- User can toggle email notifications on/off for their user account.
- User can view all routes on dashboard as a table.
- User can view how many routes are in the table from a value displayed on the dashlet header.
- User can view route name, operator, start terminus, end terminus, and last date modified from the dashboard level of the routes table.
- User can filter the list of routes by entering text into the search field.
- User can sort the table rows by clicking a column header to toggle ascending/descending order where possible. This will be chronological for dates, numerical for numbers, and alphabetical for text.
- User can select a route to be navigated to the route details screen.
- Ability to create a new service change directly from the dashboard.

Routes Details Screen:

- User can see a header that informs them they are on the route details screen.
- User can see a breadcrumb trail style navigation to help indicate where they are and easily return to a previous view.

- User can view all the information available for the selected route within a route details dashlet.
- User can view all the associated service changes within an associated service changes dashlet.
- User can create a service change from the selected route.
- User can view how many associated service changes are in the table from a value displayed on the dashlet header.
- User can view high level information for each service change in relation to each column header in the service change dashlet. The data that should be visible is route number, service change number, implementation date, route specification name, status, description.
- By default, every time a user lands on a route details screen, the associated service change table will be sorted in chronological order of the implementation date ensuring the next service change to be implemented is always on the top of the list.
- User can sort the associated service changes table where possible by toggling the column header. This will switch between ascending and descending order of the column, chronological for dates, progress for status, numerical for number values, and alphabetical for text. Sorting is not cumulative.
- User can filter the list of associated service changes by entering text into the search field. This is a global search.
- User can filter to show/hide associated service changes that are deleted (archived).
- By default, associated service changes that are deleted are hidden.
- User can select an associated service change to be navigated to the associated service change details screen.
- User can view the route schedule as a calendar in the route schedule dashlet.
- User can select a month and year from a date picker to change when the calendar starts in the route schedule dashlet.
- Where information is available, the user can see what trip types (Mon-Thu, Fri-Sat, Sun) are scheduled for each day within the calendar on the route schedule dashlet.

Create Service Change Form:

- When created from the dashboard, the user can enter all fields in the create service change form.
- User can enter title, state, implementation date, end date, route, operator, description (templated), type (dropdown selection menu), additional info.
- When a route is selected, the operator is automatically assigned.
- When operator is automatically assigned, it can still be changed to UNKNOWN if the service change is for a new tender.

- If the user selects operator first, the user can only select routes that are assigned to that operator. Unless they select UNKNOWN in the case of a new tender.
- When created from the route details screen the user can see that the route and operator fields are prepopulated, but editable.
- User can clear individual inputs of the form.
- User can clear the form.
- When the user selects a TYPE in the create service change form, the description field will be prepopulated with a template string associated to that type.
- User can select multiple types, and the templated strings will be concatenated within the description field.
- User can always edit the description field.
- User can save and submit the service change creation.
- User will see a clear error message if the submission cannot be done due to incorrect input.
- User can clearly see if any mandatory fields have been missed or input incorrectly.
- User would see a clear error message if the submission failed.
- If a submission fails, it will not remove any form inputs, it will highlight where any input errors exist and display a message to the user about the problem, so that the user can fix the issues and try again.
- User will see an indication of progress as a new service change is being created.
- User is navigated to the service change details screen for the newly created service change.

Service Change Details Screen:

- User can see a header that informs them they are on the service change details screen.
- User can see a breadcrumb trail style navigation to help indicate where they are and easily return to a previous view.
- User can view all the information available for the selected service change within a service change details dashlet. This information includes title, state, implementation date, end date, route, operator, description, type, additional info.
- User can edit the title, state, implementation date, end date, route, operator, description (templated), type (dropdown selection menu), additional info.
- User can Abandon a service at any stage (except while validating a schedule file to avoid any unexpected behaviour).
- User will be informed that they cannot Abandon a service change while schedule file is being validated if they attempt to do so.

- Abandoning a service change will archive the service change and will only be visible when the user toggles to show deleted service changes.
- Abandoning a service change will automatically change the state to deleted
- User can view all the associated service requests within a service requests dashlet.
- If no service requests are available, the user will see a message telling them that they need to go into Novus to create service requests. This is because Service Request creations will be initiated from the Service Change in Novus so that the workflow can be simplified.
- User can view high level information for each service request in relation to each column header in the service request dashlet. The data that should be visible will be Name/title, due date, service change (SC ref), route, operator, state, and last updated.
- By default, every time a user lands on a service change details screen, the service request table will be sorted by reverse chronological order to ensure the latest service request created is always on the top of the list.
- User can sort the service request table where possible by toggling the column header. This will switch between ascending and descending order of the column, chronological for dates, numerical for number values, and alphabetical for text.
- User can select a service request to be navigated to the service request details screen.
- User can send a service request to the operator from the service request dashlet.
- Service Change states:
 - (AMBER) Pending: This is when a service change is in progress.
 - (GREEN) Complete: This is when a service change has received a validated schedule file.
 - (GREY) Deleted: This is when a service change has been abandoned.

Service Request Creation:

- User can create a service request from the route spec screen in Novus
- Once a service request has been created, it will automatically be associated to the correct service change and the headers will be exported into the documents dashlet.
- Once created, the user can edit a service request to assign recipients and add a message for the recipient.

Service Request Details Screen:

- User can see a header that informs them they are on the service request details screen.
- User can see a breadcrumb trail style navigation to help indicate where they are and easily return to a previous view.
- User can edit the title, description, message and recipients of a selected service request.

- When editing or adding recipients for a service request where the associated service change is set to UNKNOWN for operator, this is a new tender, therefore the user can select operators to filter the options for user accounts to add to the recipient list.
- User can view the schedule header files assigned to the service request under the documents section.
- User can view state, Name/title, due date, service change (SC ref), route, operator, state, and last updated in the details dashlet.
- User can view the list of service requests in chronological order so that the next due date is always first by default.
- User can sort the documents table where possible by toggling the column header. This will switch between ascending and descending order of the column, chronological for dates, numerical for number values, and alphabetical for text.
- User can filter the list of documents by entering text into the search field.
- User can see when documents were added to a selected service request.
- User can see what user added documents to a selected service request.
- User can download documents to a selected service request.
- User can upload documents to a selected service request.
- User can send service request to operator.
- When sending to the operator, the user can select which user account(s) for that operator they wish to send the service request to.
- User can only send to operators that are assigned to the route associated to the service request, unless the operator is set to UNKNOWN during the service change creation.
- If the operator for the route associated to the service request is UNKNOWN, the user can select any operator(s) within the collaboration portal when sending the service request to an operator.
- When a user sends a service request that has the operator set to UNKNOWN for a new tender, the user will be returned to the service change screen where collaboration portal will duplicate the service request for each operator in the service change so that the TfL user can see each response.
- User cannot submit to send to operator unless a recipient has been selected.
- Service Request states:
 - (AMBER) Pending: This is when a service request is in progress, before it has been sent to the operator(s).
 - (AMBER) Waiting: This is when a service request has been sent to the operator but has not received a schedule file yet.
 - (AMBER) Validating: This is when a service request has received a schedule file, and Novus is in the process of validating it.

- (RED) Failed: This is when a service request has received a schedule file, but Novus was not able to validate it.
- (GREEN) Validated: This is when a service request has received a schedule file, and Novus was able to validate it.

TfL Admin User

- User can do everything that a TfL User can do
- User can view other user's permissions
- User can edit other user's permissions through LDAP This is managed externally.

Operator User

Dashboard:

- User must be able to log in.
- User will see a clear error message if the log in cannot be validated due to incorrect or incomplete input.
- User will see a clear error message if the log in fails.
- User must be able to reset password.
- User must be able to log out.
- User must land on dashboard upon log in.
- User can see a header that informs them they are on the dashboard.
- User should see local authority logo on dashboard.
- User should be able to view their user profile details.
- User can view their assigned permissions.
- User can toggle email notifications on/off for their user account.
- Users do not have a routes dashlet.
- User can see service request dashlet with all their assigned service requests on their dashboard.
- User can ONLY see service changes related to routes assigned to them, or UNKNOWN operator.
- User can view all service requests received on the dashboard as a table.
- User can view state, due date, title name, route, operator, service change ref ID, and last date modified from the service request table on the dashboard.
- User can view the list of service requests in chronological order so that the next due date is always first by default.
- User can filter the list of service requests by entering text into the search field. This is a global search.

- User can sort the table rows by clicking a column header to toggle ascending/descending order where possible. This will be chronological for dates, numerical for numbers, and alphabetical for text.
- User can select a service request to be navigated to the service request details screen.

Service Request Details Screen:

- User can see a header that informs them they are on the service request details screen.
- User can see a breadcrumb trail style navigation to help indicate where they are and easily return to a previous view.
- User can view Name/title, due date, service change (SC ref), route, operator, state, last updated in the service request details dashlet.
- User CANNOT edit a selected service request.
- User can view the schedule header files assigned to the service request under the documents section.
- By default, every time a user lands on a service request details screen, the documents table will be sorted in chronological order to ensure the latest document added is always on the top of the list.
- User can sort the documents table where possible by toggling the column header. This will switch between ascending and descending order of the column, chronological for dates, numerical for number values, and alphabetical for text.
- User can filter the list of documents by entering text into the search field.
- User can see when documents were added to a selected service request.
- User can see what user added documents to a selected service request.
- User can download documents to a selected service request.
- User can upload a single schedule file to the schedule file dashlet.
- User can upload multiple schedule files to the schedule file dashlet.
- User can upload multiple schedule files with a single zip file to the schedule file dashlet.
- User can select a schedule file from their device when uploading to the schedule file dashlet.
- User can remove an uploaded schedule file before sending to operator in case they uploaded the wrong file.
- User can replace schedule file(s) after validation is complete, this will overwrite the previous schedule file(s).
- If no schedule file has been uploaded, the user will see a message informing them that no file has been uploaded yet.
- If a schedule file has been selected for upload, the user will be able to submit (validate and send) the uploaded files.

- While a schedule file is being validated the state of the service change to 'Validating'.
- While a schedule file is being validated the user will be informed of progress where possible.
- While a schedule file is being validated the user cannot upload another schedule to this service change.
- If Novus successfully validates the schedule file, the status will change to 'Validated', the user will be able to see a success message on the schedule file dashlet.
- If Novus successfully validates the schedule file, the user who created the service change will receive an email notification informing them the schedule file has been validated.
- If Novus cannot validate the schedule file, the status will change to 'Invalid', the user will be able to see a message on the schedule file dashlet asking them to review the error report, fix the issues, and try again.
- If Novus cannot validate the schedule file, the operator user who submitted the schedule file(s) will receive an email notification informing them of the failed validation.
- If validation is unsuccessful the user will see a message on the dashlet that the schedule file validation has failed.
- If validation is completed successfully the user will see a message on the dashlet that the schedule file is validated.
- Once validation is complete the user can download the error/warning report.
- Once validation is complete the user can download the schedule file from the schedule file dashlet.
- Once validation is complete the user can upload a schedule file to replace the previous one and trigger the validation process again.
- Once validation is completed successfully, there are no more actions from any collaboration portal user.
- When sending to the operator, the user can select which operator account(s) they wish to send the service request to.
- User can only send to operators that are assigned to the route associated to the service request, unless the operator is set to UNKNOWN during the service change creation.
- If the operator for the route associated to the service request is UNKNOWN, the user can select any operator(s) within the collaboration portal when sending the service request to an operator.
- Operator user can see service request dashlet with all their assigned service requests on their dashboard.
- Operator user can only see service changes related to routes assigned to them, or UNKNOWN operator.

- Operator user can see all their assigned service changes listed in their service change dashlet.
- Operator user can sort service changes list by route.
- Operator user can only receive service change and requests for routes assigned to them, or UNKNOWN operator.
- Operators can accept service requests that have been sent to them by uploading a schedule file.
- Operators can attach a schedule file when accepting a service request.
- Operators can reject service requests that have been sent to them.
- Operators can enter a reason when rejecting a service request.
- If the operator rejects the service request, the user who created the service change will receive an email notification informing them of the rejection and the reason for the rejection.
- Service Request states:
 - (AMBER) Waiting: This is when a service request has been sent to the operator but has not received a schedule file yet.
 - (AMBER) Validating: This is when a service request has received a schedule file, and Novus is in the process of validating it.
 - (RED) Failed: This is when a service request has received a schedule file, but Novus was not able to validate it.
 - (GREEN) Validated: This is when a service request has received a schedule file, and Novus was able to validate it.

Permissions

Access permissions should be dynamically based on the state of the object (e.g., Service Changes and Service Requests). When the status of an object changes, the associated permissions should automatically update to reflect the new state.

Permissions for service changes:

- All statuses are visible to everyone except 'Provisional confidential' Which is only visible to these groups:
 - Contracts Tendering and Evaluation
 - Monitoring & Implementation: Data
 - Performance Team
 - PTSP: Specification Team
 - Admin
- All Statuses are only editable to by these groups, everyone else has ready only access:

- Contracts Tendering and Evaluation
- Monitoring & Implementation: Data
- Performance Team
- PTSP: Specification Team
- Admin

Permissions for service requests:

- All types are visible to all but only editable by these groups:
 - Contracts Tendering and Evaluation
 - Monitoring & Implementation: Data
 - Performance Team
 - PTSP: Specification Team
 - Admin

Service requests associated with service changes of the type 'New Tender':

- All types are only visible and editable by the following groups:
 - Admin
 - Contracts Tendering and Evaluation
 - PTSP: Specification Team

Other items

- Migrate data available in Novus from historical service changes and service requests.
